NEW - KRYSTOL LEAK REPAIR KIT

Kryton now makes it easier for contractors to try the Krystol Leak Repair System with our NEW Krystol Leak Repair Kit.

The NEW [Krystol Leak Repair Kit](#) (K-510-KIT) conveniently combines Krystol Plug, Krystol Repair Grout and Krystol T1 with kit specific application instructions, measuring cups and a crack depth measuring gauge. This kit provides enough material to treat approximately 6 meters (20 feet)** of leaking cracks, holes or joints, as well as offers an easy low risk way for contractors to try the best waterproofing repair products available.

With cost and performance benefits over injection systems, the Krystol Leak Repair System puts more profits in the contractor's pockets, while providing a permanent waterproofing solution - even against high water flow and pressure.

Kryton's Leak Repair system is the easiest and most reliable repair system available. It uses Kryton's Krystol crystalline technology, which reacts with water and unhydrated cement particles to grow needle-shape crystals within the concrete. These insoluble crystals block capillary pores and fill cracks to stop the ingress of water and make the concrete itself a permanent waterproof barrier.

Application is simple, and made easier due to a QR code placed on the packaging linking to the [Leak Repair Video](#). QR Reader apps are easily downloaded for free to any smartphone.

The Krystol Leak Repair system is not complicated, and requires only basic, readily available tools to install the system. These tools are highlighted in the [kit specific application instructions](#).

Gain exposure and make it easier to get into a contractors hands by ordering the Krystol Leak Repair Kit today. Talk to your Territory Manager, or our customer service department for more information.

****based on the recommended 40mm x 25 mm chase**

KIT CONTAINS:

1 x 5 kg (11 lbs)
Krystol Plug
(Rapid Setting Hydraulic
Cement)

Detailed Instructions

1 x 5 kg (11 lbs)
Krystol T1
(Surface Applied
Waterproofing Slurry)

Crack Depth
Measuring Guide

2 x 5 kg (11 lbs)
Krystol Repair Grout
(Crystalline Waterproofing
Grout with Anti-shrink
Reinforcing Fibers)

2 x Measuring Cup

Note: You will need an electric chipping hammer with a 1" chisel bit, drill and mixing paddle, as well as common masonry tools.

OTHER NEW PRODUCTS FROM KRYTON:

1. [Kryton's Crack Inducing Waterstop](#) is specially engineered to produce waterproof crack control joints in new concrete construction.

Commonly overlooked during the design phase, crack control joints are needed when integrally waterproofing concrete, as uncontrolled cracking will lead to water intrusion and repairs.

If the back side of the wall is exposed, keyways can easily be aligned on the positive and negative side when forming. These aligned keyways will induce a crack control joint, which are then filled with the Krystol Waterstop Grout before backfilling. In areas where backfilling is not possible, and access is limited, the Crack Inducing Waterstop is needed. It is installed on the blind (or shoring) wall, and aligned with a keyway that produces an accurate crack controlled joint. As the Crack Inducing Waterstop locks into the outside of concrete, it also acts as a waterstop becoming the first line of defense against water intrusion. Learn more about Kryton's Crack Inducing Waterstop [here](#).

2. Introduced last month, the [Krystol Waterstop Grout](#) has been highly successful in reducing inventory and simplifying Kryton's Krystol Waterstop System, which is used for Construction Joints and Details. With a smooth transition and wide acceptance of the multi-use grout, which is used for both internal and external grout methods, Kryton will start to phase out the internal specific, red, grout. Any projects where this product (K-322i) may be needed, should be brought forward to your Territory Manager.
